

# VGA

## Video Graphics Array

Video Graphics Array is often replaced by HDMI, however, VGA still remains popular.

### How long can a VGA cable be?

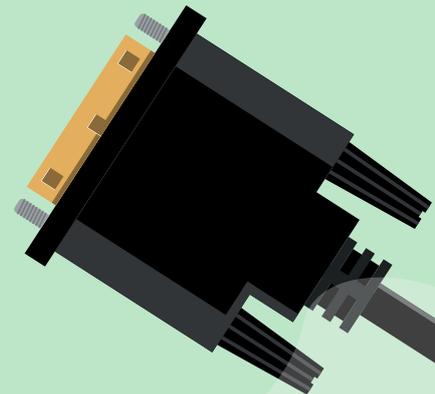

OE Electrics supply VGA cables in 1.8m, 3m, and 5m lengths. We recommend that the total cable length from source to screen should be no more than 7.5m; this includes the cable used to connect the screen to our unit.

The quality of the cable can impact image quality. OE Electrics only sells cables that are gold plated to ensure that quality is not lost.

### What if I need a cable longer than 7.5m?

A VGA booster/amplifier can be used to increase the maximum cable length.

Or, alternatively, a VGA to ethernet adapter could be used. In theory, this solution should mean that there is an unlimited possible cable length.
